Add WeChat powcoder

# Building with Pipelines

- CPI for pipelining:
  - 1 (ideal case - no stalls)
  - $> 1$  (reality, depends on program)
- What if we want to improve performance more?
  - Want CPI as low as possible – lower than 1
- Use Parallelism
  - Instruction Level Parallelism (ILP) – Within task
  - Thread Level Parallelism (TLP) – Having many tasks
  - Data Level Parallelism (DLP) – Many tasks with same instructions

# Assignment Project Exam Help

## LC2K Pipeline Summary

Pipeline  
Performance

Fetch	Decode	Execute	Memory	WB
PC read		Need register values	Branches resolved	Register values produced

- Data hazards

- Hazard exists if producer-consumer of a register within a 2-instruction window
  - Note for project, the window is 3 instructions
- Detect and stall – insert enough noops to separate producer and consumer by  $> 2$  instructions ( $> 3$  instructions for project)
- Detect and forward
  - Handles all cases except LW-USE, need 1 noop here

- Control hazards

- Detect and stall – needs 3 noops inserted after each branch
- Predict and squash
  - Zero noops if predict correctly
  - 3 if predict incorrectly

# Assignment Project Exam Help

## Review: Basic Performance Equation

Add WeChat powcoder

- Execution time (Time/Program) =
  - # of instr (I/P) x CPI (C/I) x cycle time (T/C)

Assignment Project Exam Help

- Multi-cycle decreases cycle time but increases CPI

Add WeChat powcoder

- Pipelining decreases CPI
  - Approaches 1.0 if no stalls (hazards that are fixed by stalling)

# Calculating Performance with No Stalls

How many cycles does this code take to execute?

add	1	2	3
nor	1	4	5
add	4	6	7

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

What value is written to the ALU result field of the Mem/WB pipeline register at the end of cycle 5.
