Assignment Project Exam Help

Learning Objectives

Add WeChat powcoder

- To identify the information of an Instruction Set Architecture (ISA)
 - Be able to identify trade-offs relevant to ISA design
 - Identify basic, course-granularity operation of a computer
 - Fetch, Decode, Execute
- Assignment Project Exam Help
- <https://powcoder.com>

Add WeChat powcoder

Instruction Set Architecture (a.k.a. Architecture)

Add WeChat powcoder

Instruction Set Architecture (ISA)

- An abstract interface between the hardware and the lowest-level software that encompasses all the information necessary to write a machine language program that will run correctly, including instructions, registers, memory accesses, I/O, and so on.

Assignment Project Exam Help

<https://powcoder.com>

Instruction Set Architecture (ISA)

Includes anything programmers need to know to make a binary program work correctly

Instruction Set Architecture (ISA)

Defines interface between hardware and software

Assignment Project Exam Help

ISAs

Add WeChat powcoder

Application software

Compilers

Architecture – a.k.a. ISA

- Platform-specific
- A limited set of assembly language commands available by hardware
 - e.g., ADD, LOAD, STORE, RET

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The software /
hardware divide

Microarchitecture – hardware implementation of ISA

- Intel Core i9/i7/i5 implements x86 ISA (desktop/laptop)
- Apple A9 implements ARM v8-A ISA (iPhone)

Circuits

Devices

Add WeChat powcoder

The software /
hardware divide

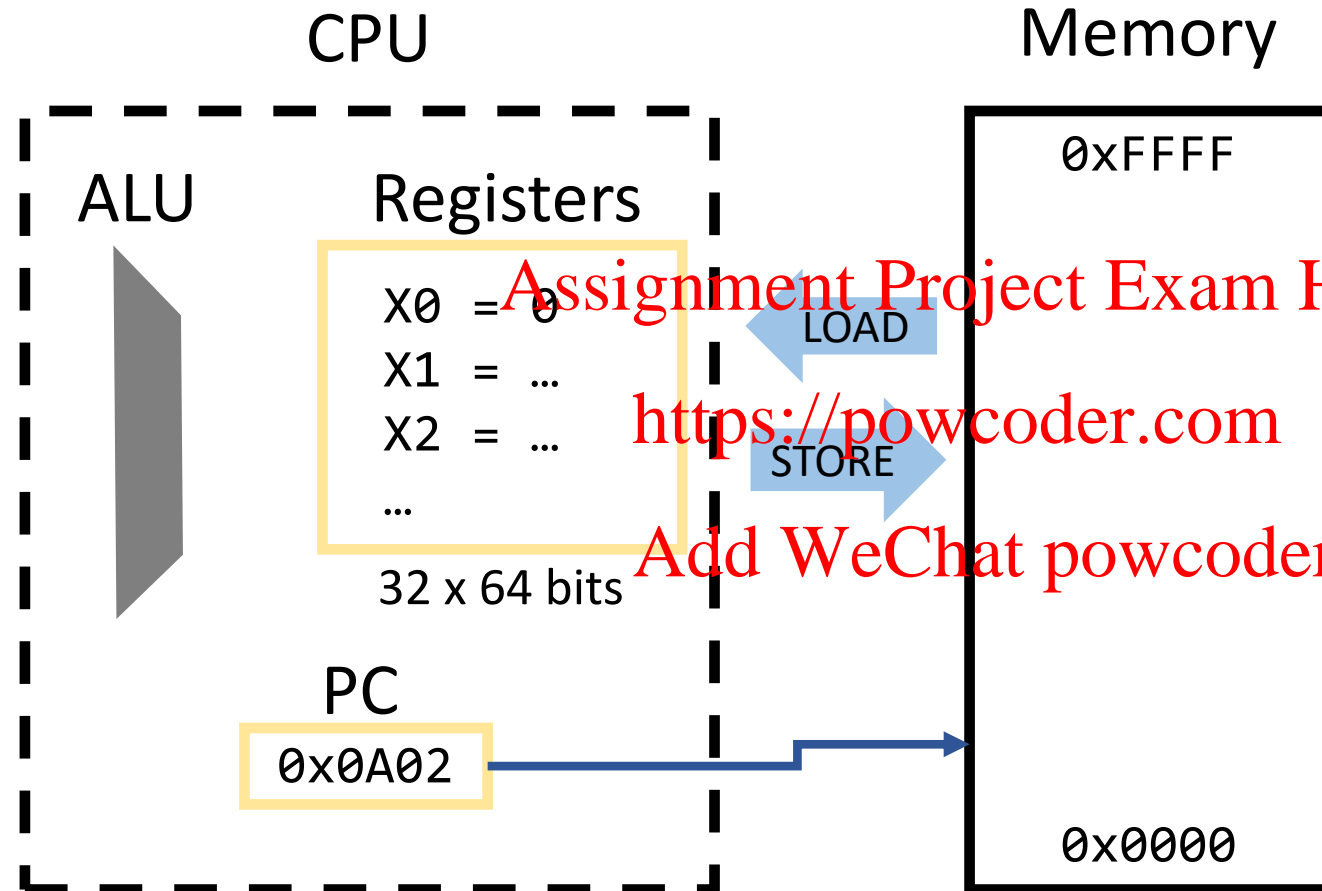

Microarchitecture – hardware implementation of ISA

- Intel Core i9/i7/i5 implements x86 ISA (desktop/laptop)
- Apple A9 implements ARM v8-A ISA (iPhone)

Circuits

Devices

(Simplified) System Organization

CPU – Central Processing Unit

ALU – Arithmetic Logic Unit, executes instructions

PC – Program Counter, holds address (in memory) of next instruction

Assignment Project Exam Help von Neumann Architecture

Add WeChat powcoder

- von Neumann Architecture

- Data and instructions are stored in the same memory
- Programs (instructions) can be viewed as data – simplifies storage
- Data can be viewed as instructions – complicates security

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Assignment Project Exam Help von Neumann Architecture

Add WeChat powcoder

- von Neumann Architecture
 - Data and instructions are stored in the same memory
 - Programs (instructions) can be viewed as data – simplifies storage
 - Data can be viewed as instructions – complicates security
- Instructions are stored sequentially in memory
 - Accessed by the program counter (PC) —it contains the address/location of the instruction the hardware is executing
 - The PC is simply incremented to “point to” the next instruction
 - “jumps” / “branches” override fetching the sequential next instruction
 - Terminology: Jumps are usually unconditional, and branches are conditional on a flag being checked
 - there are conditional jumps....

Assignment Project Exam Help von Neumann Architecture

Add WeChat powcoder

1. Fetch – get the next instruction. Use the PC to find instruction, put into instruction register (IR).
1. The PC is changed to “point” to the next instruction in the program
2. Assume that the next instruction is sequential and contiguous in memory

Assignment Project Exam Help

4. Go to step 1

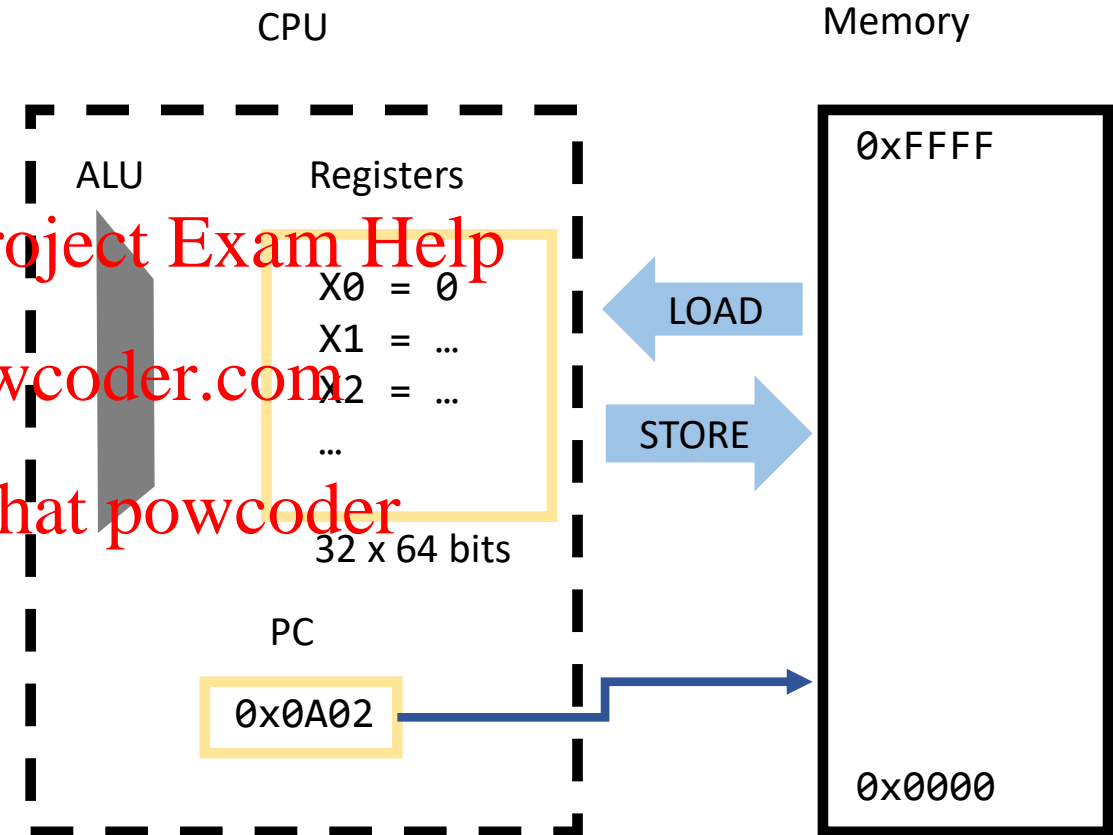

Assignment Project Exam Help

Instruction Set Architecture – Design Space 1

Add WeChat powcoder

- What instructions should be included?
 - add, multiply, divide, sqrt [functions]
 - branch [flow control]
 - load/store [storage management]
- What storage locations?
 - How many registers?
 - How much memory?
 - Any other “architected” storage?
- How should instructions be formatted?
 - 0, 1, 2 or more operands?
 - Immediate operands

Assignment Project Exam Help

Instruction Set Architecture – Design Space 2

Add WeChat powcoder

- How to encode instructions?
 - **RISC** (Reduced Instruction Set Computer):
all instructions are same length (e.g. ARM, LC2K)
smaller set of simpler instructions
 - **CISC** (Complex Instruction Set Computer):
instructions can vary in size (Digital Equipment's VAX, x86)
large set of simple and complex instructions
- What instructions can access memory?
 - For ARM and LC2K, only loads and stores can access memory
(called a “**load-store architecture**”)
 - Intel x86 is a “**register-memory architecture**”, that is, other instructions beyond load/store can access memory
 - Also Compute in Memory (currently a research topic) – simple operations performed in memory without data moving to/from the processor.

Many Choices, Many ISAs

Assignment Project Exam Help
Add WeChat powcoder

- Why are there many ISAs?
 - Many problem domains, design constraints (e.g., power), differences of opinion

Assignment Project Exam Help

- How often are new architectures created?
 - New embedded processors are created all the time
 - Existing ISAs are extended for new problem domains
 - X86: MMX, MMX2, SSE, AVX, x87, x64
- Can you design one?
 - Yes!

Add WeChat powcoder

Assignment Project Exam Help Assembly Code – Instruction Encoding

Add WeChat powcoder

- Fields

- Opcode – What instruction to perform
- Source (input) operand specifier(s)
 - What data to perform operation on
- Destination (output) operand specifier(s)
 - What data to be updated

opcode	dest	src1	src2
ADD	X2	X1	100

Execution: value in register X2 = contents reg. X1 + constant 100

Assignment Project Exam Help

Assembly Code - Properties

Add WeChat powcoder

- Generally 1-1 correspondence with machine language
- Mnemonic codes facilitate programming
- Labels (symbolic names)
- Direct control of the what processor does
- May execute fast, if you're good at it, but compilers can typically generate better code
- Still hard to use and not portable to other brands of machines

Using 6 bits, how many opcodes can this ISA implement?

Assignment Project Exam Help

Assembly – Register Addressing

Add WeChat powcoder

Example ISA
(Simplified)

000 → 111

Using 6 bits, how many opcodes can this ISA implement?

Add WeChat powcoder

2^m

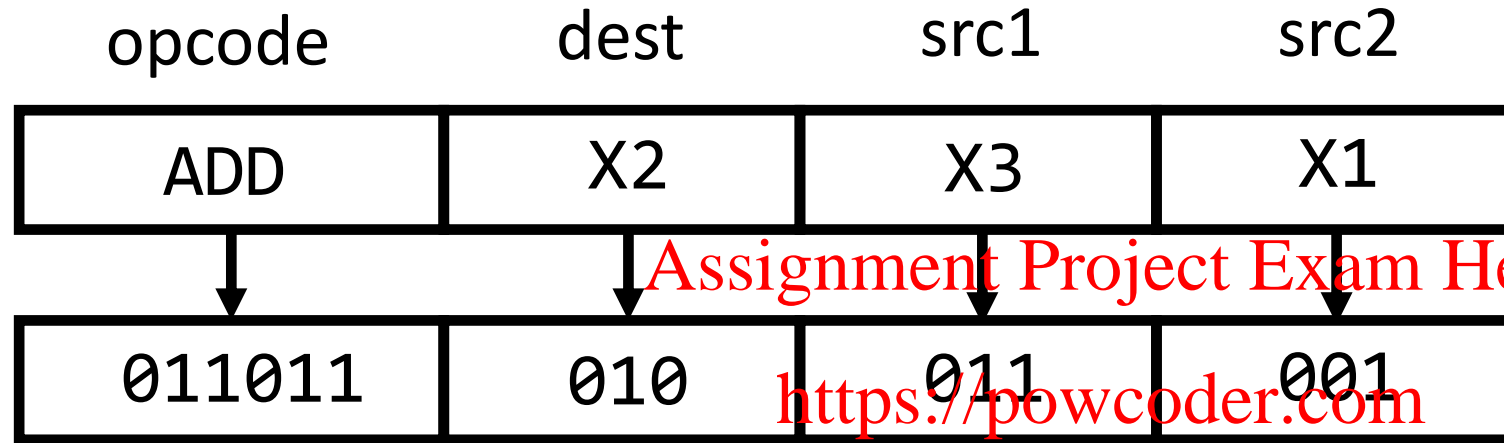

$2^6 = 64$

$2^3 = 8$

$2^2 \quad 3 \quad 4 \quad 5 \quad 6$

Assignment Project Exam Help Assembly – Register Addressing

Example ISA
(Simplified)

Using 6 bits, how many opcodes can this ISA implement?

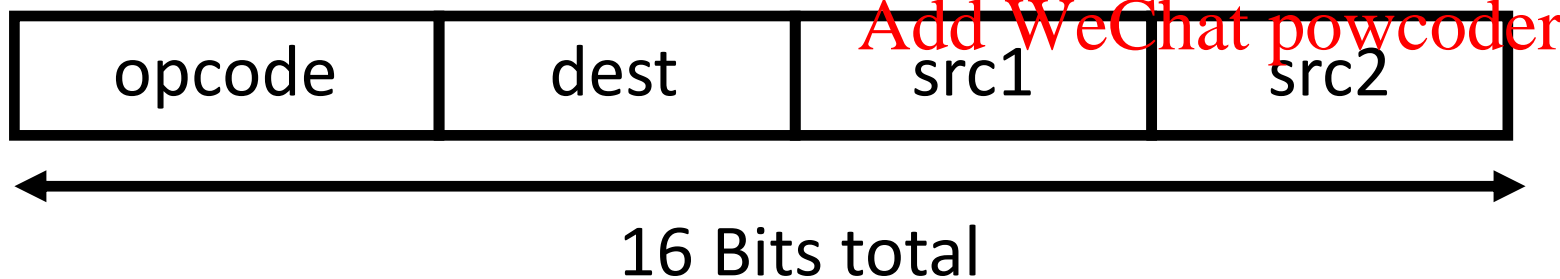

- m bits can encode 2^m different values
- n values can be encoded in $\lceil \log_2(n) \rceil$ bits
- For above
 - Can encode $2^6 = 64$ opcodes
 - Can encode $2^3 = 8$ src/destination registers

EECS 370 website has a lot of video tutorials, including binary representation
<https://www.youtube.com/watch?v=KGPfymjE2z8&feature=youtu.be>

Instruction Encoding – Example 1

What is the max number of registers that can be designed in a machine given:

- * 16-bit instructions
- * Num. opcodes = 100
- * All instructions are (reg, reg) \rightarrow reg
(i.e., 2 source operands, 1 destination operand, all operands can access all registers)

Assignment Project Exam Help

Instruction Encoding – Example 1

Add WeChat powcoder

What is the max number of registers that can be designed in a machine given:

- * 16-bit instructions
- * Num. opcodes = 100
- * All instructions are (reg, reg) → reg

$$9 / 3 = 3$$

(i.e., 2 source operands, 1 destination operand, all operands can access all registers)

16 Bits total

$$16 - 7 = 9$$

$$100$$
$$2^6 = 64$$
$$2^7 = 2 \times 2^6 = 128$$

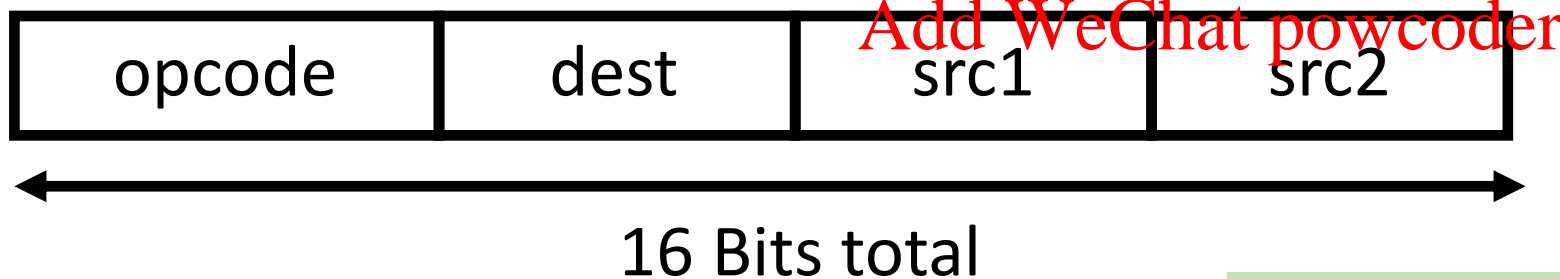

$$2^3 = 8 \text{ Reg.}$$

Instruction Encoding – Example 1

Example ISA
(Simplified)

What is the max number of registers that can be designed in a machine given:

- * 16-bit instructions
- * Num. opcodes = 100
- * All instructions are (reg, reg) \rightarrow reg
(i.e., 2 source operands, 1 destination operand, all operands can access all registers)

1. num opcode bits = $\lceil \log_2(100) \rceil = 7$
2. num bits for operands = $16 - 7 = 9$
3. num bits per operand = $9 / 3 = 3$
4. maximum number of registers = $2^3 = 8$
